FIELDWORK / CLIENT REVIEW

A clearer view of every site

Manager web + employee mobile · Client review

One workspace for the office.
One simple workflow for the field.

Structured stages

Checklist rows, visible status and direct actions.

Two taps to work

My Sites → Site → Start, Update or eligible-stage Submit.

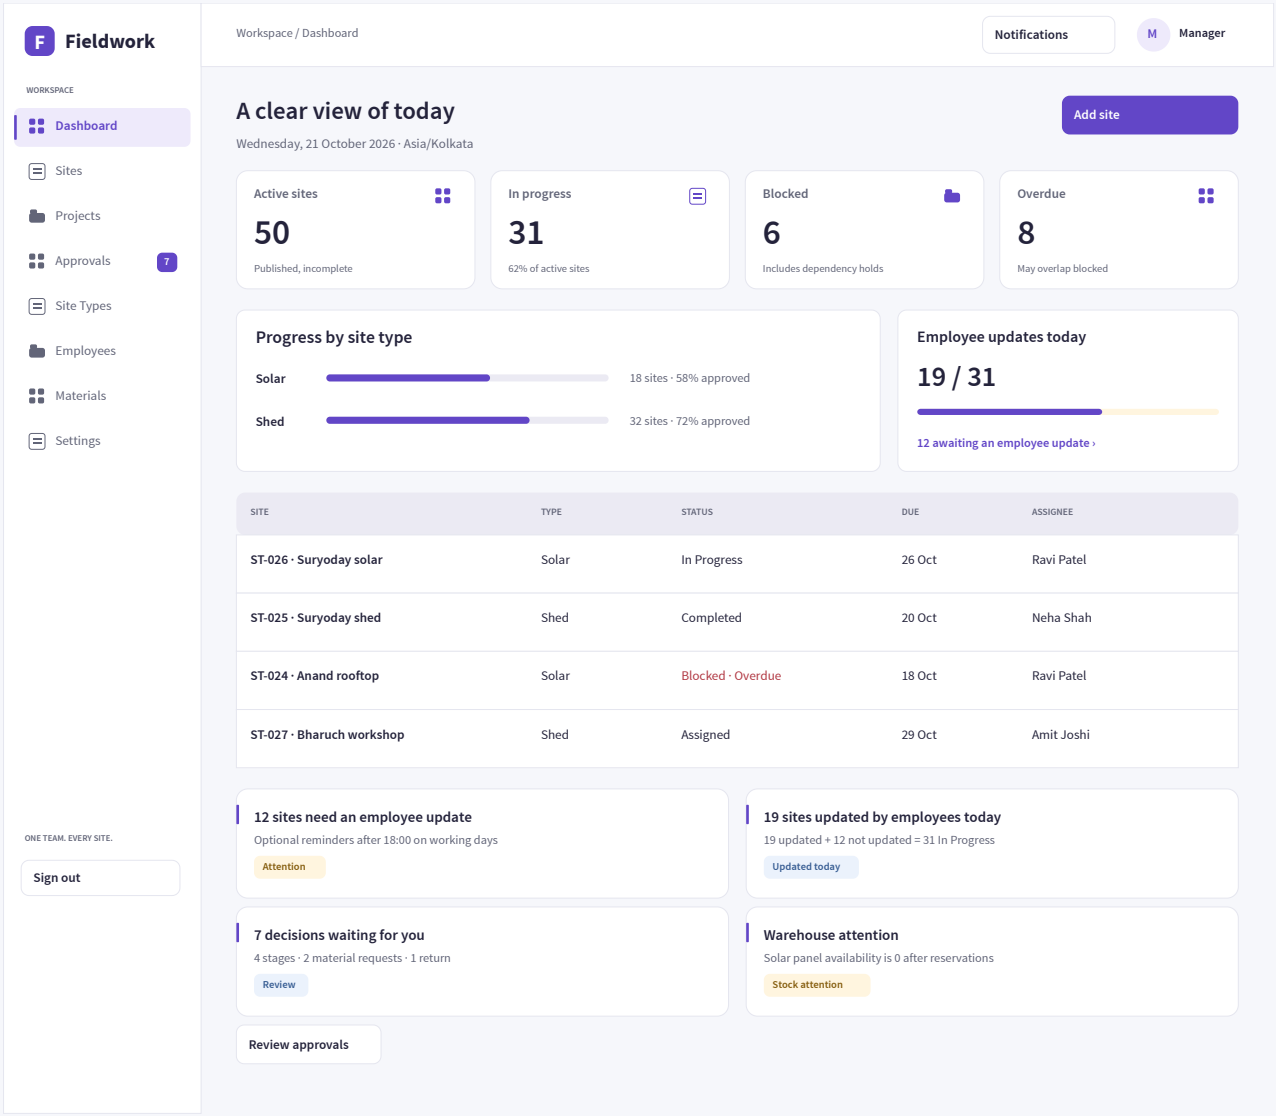

Connected context

Work, Materials and Updates in the same site workspace.

UI direction informed by the publicly shown product UI at onsiteteams.com. Original Fieldwork components and branding. Design prototype with illustrative data.

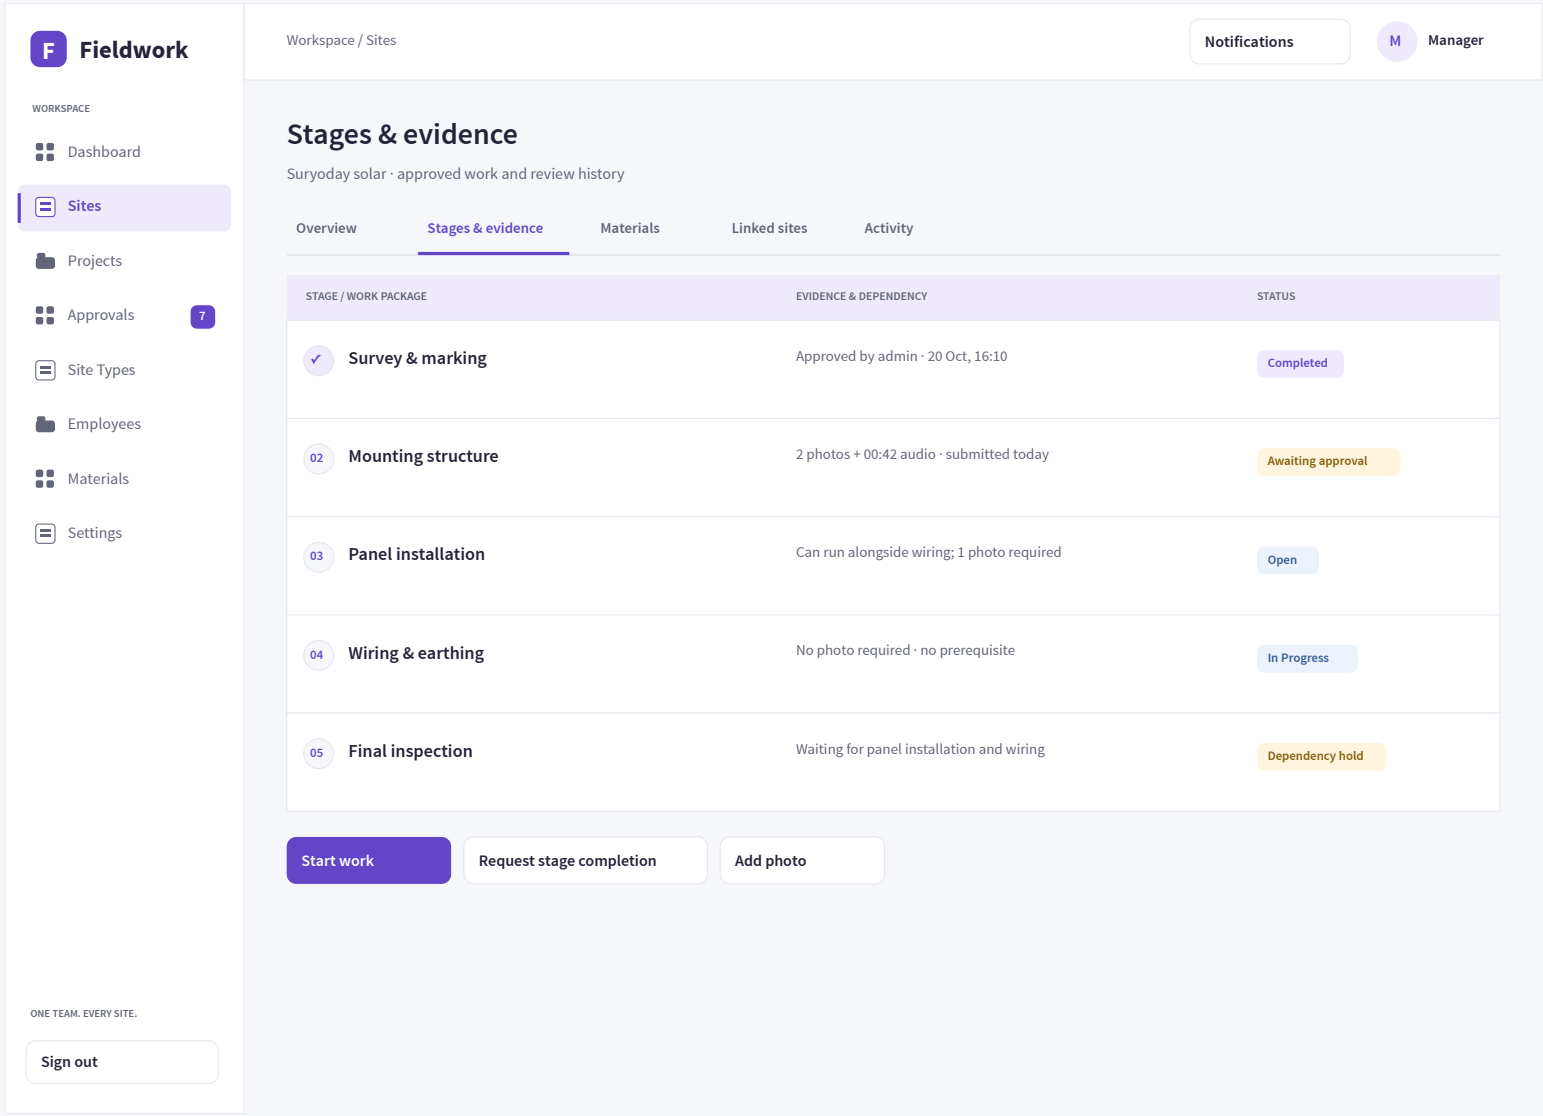

01 / Your operation at a glance

Manager dashboard · site register · decisions

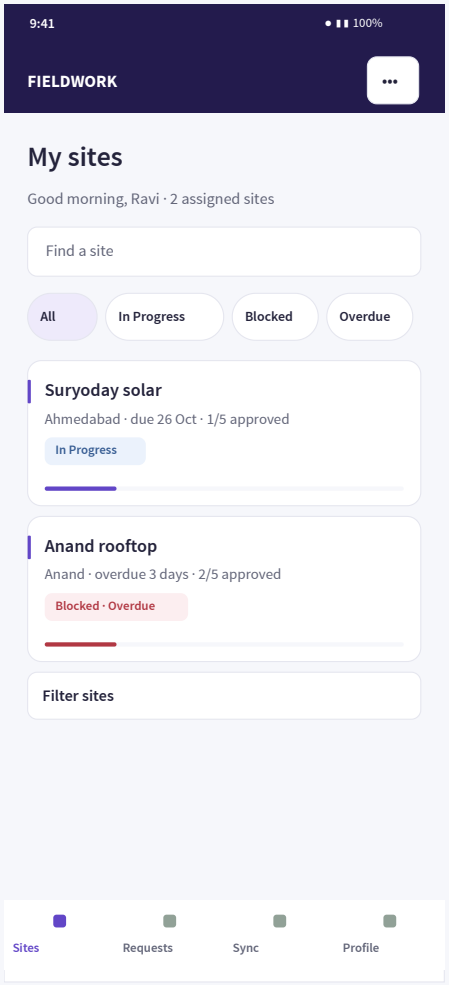

02 / Stages as a structured work register

No stage cards · evidence and dependencies stay visible

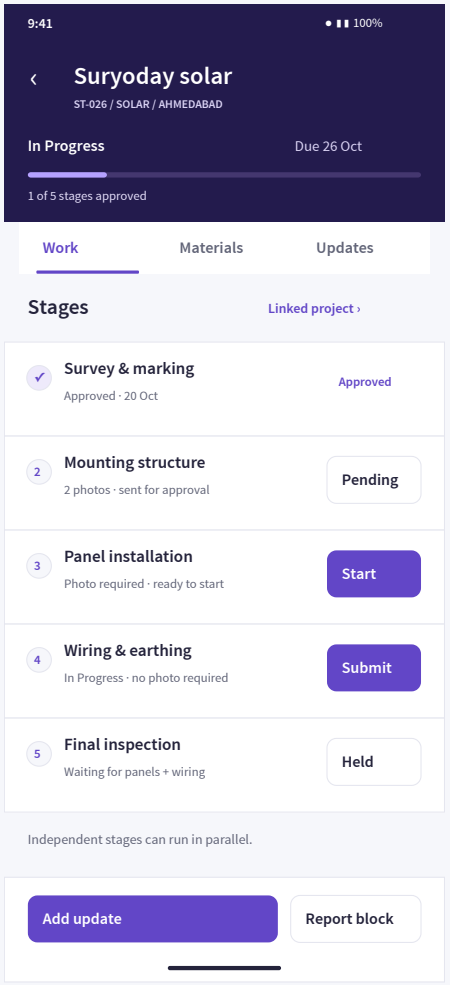

03 / From assigned site to work in two taps

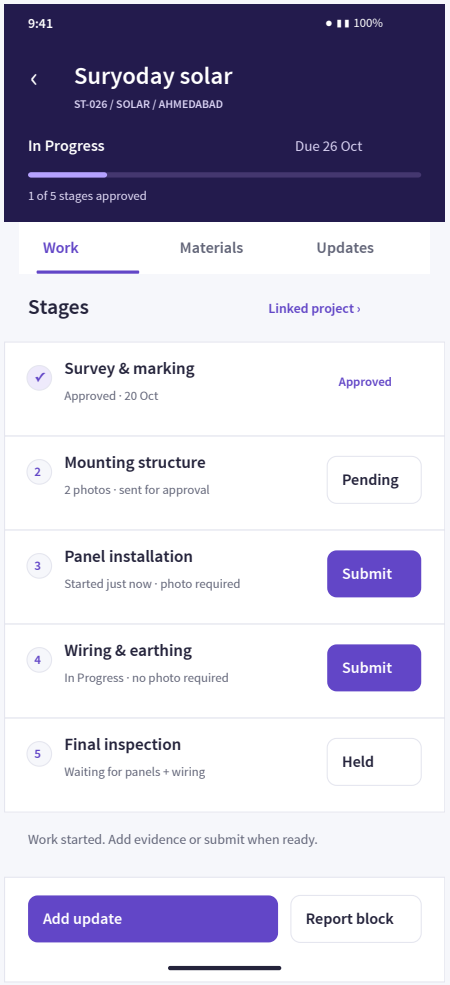

My Sites → Site workspace → Start directly in the stage row

1. Select the assigned site

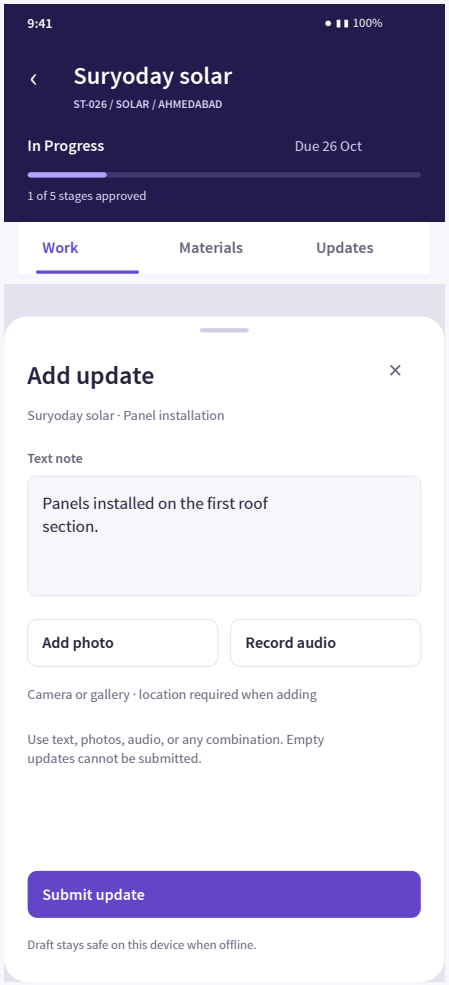

2. Start from its stage row

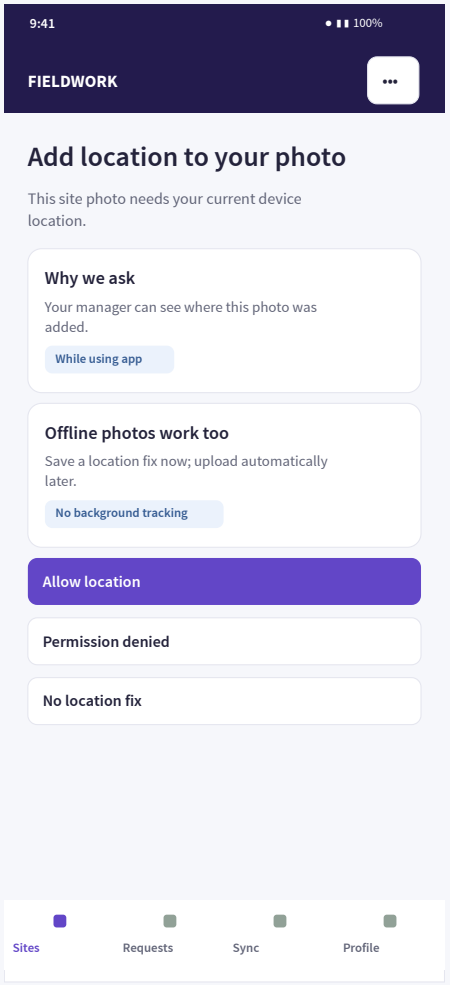

Work started · same workspace

04 / Add an update without leaving the site

Text, photos and audio · mandatory location when adding a photo

Contextual update sheet

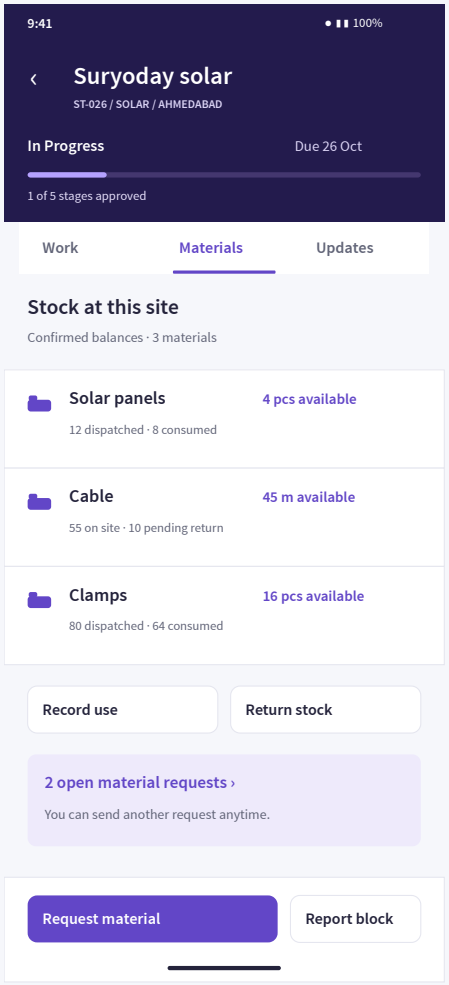

Explicit location permission

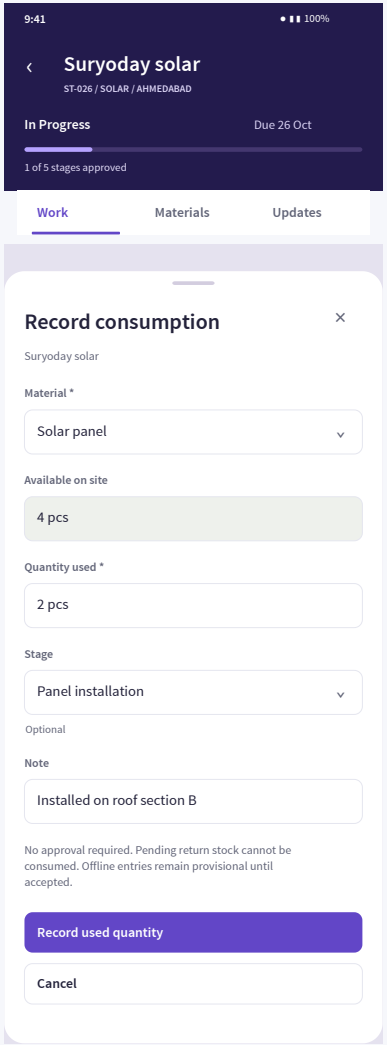

Saved location stays with the photo

05 / Materials live alongside work

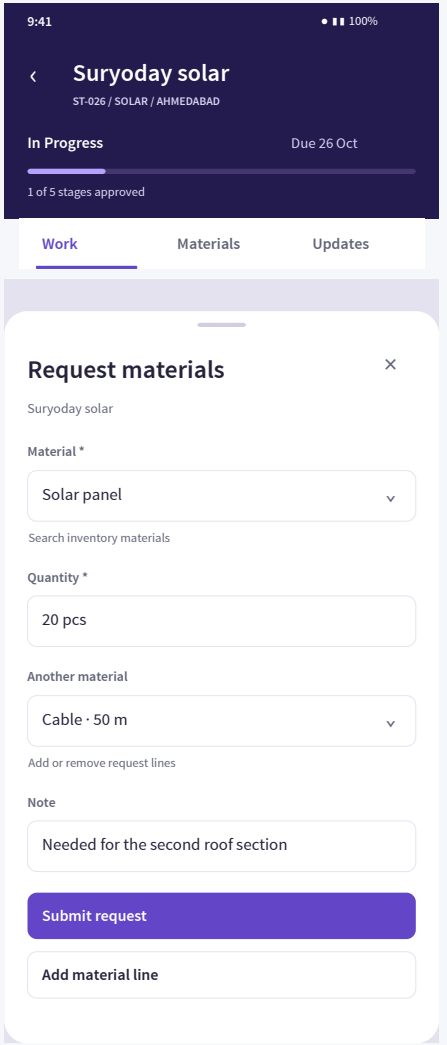

Switch tabs · record use or request more · dismiss back to Materials

Site balances + open requests

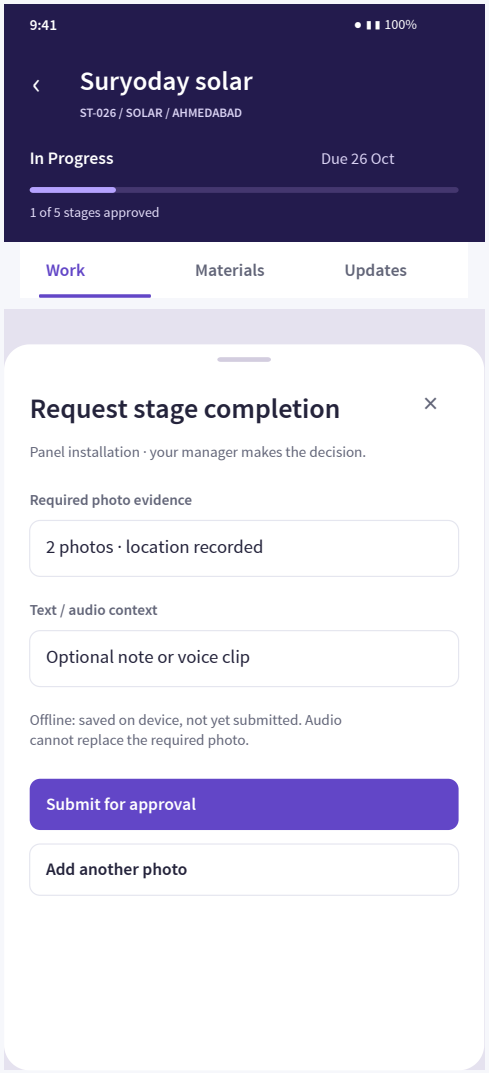

Record consumption sheet

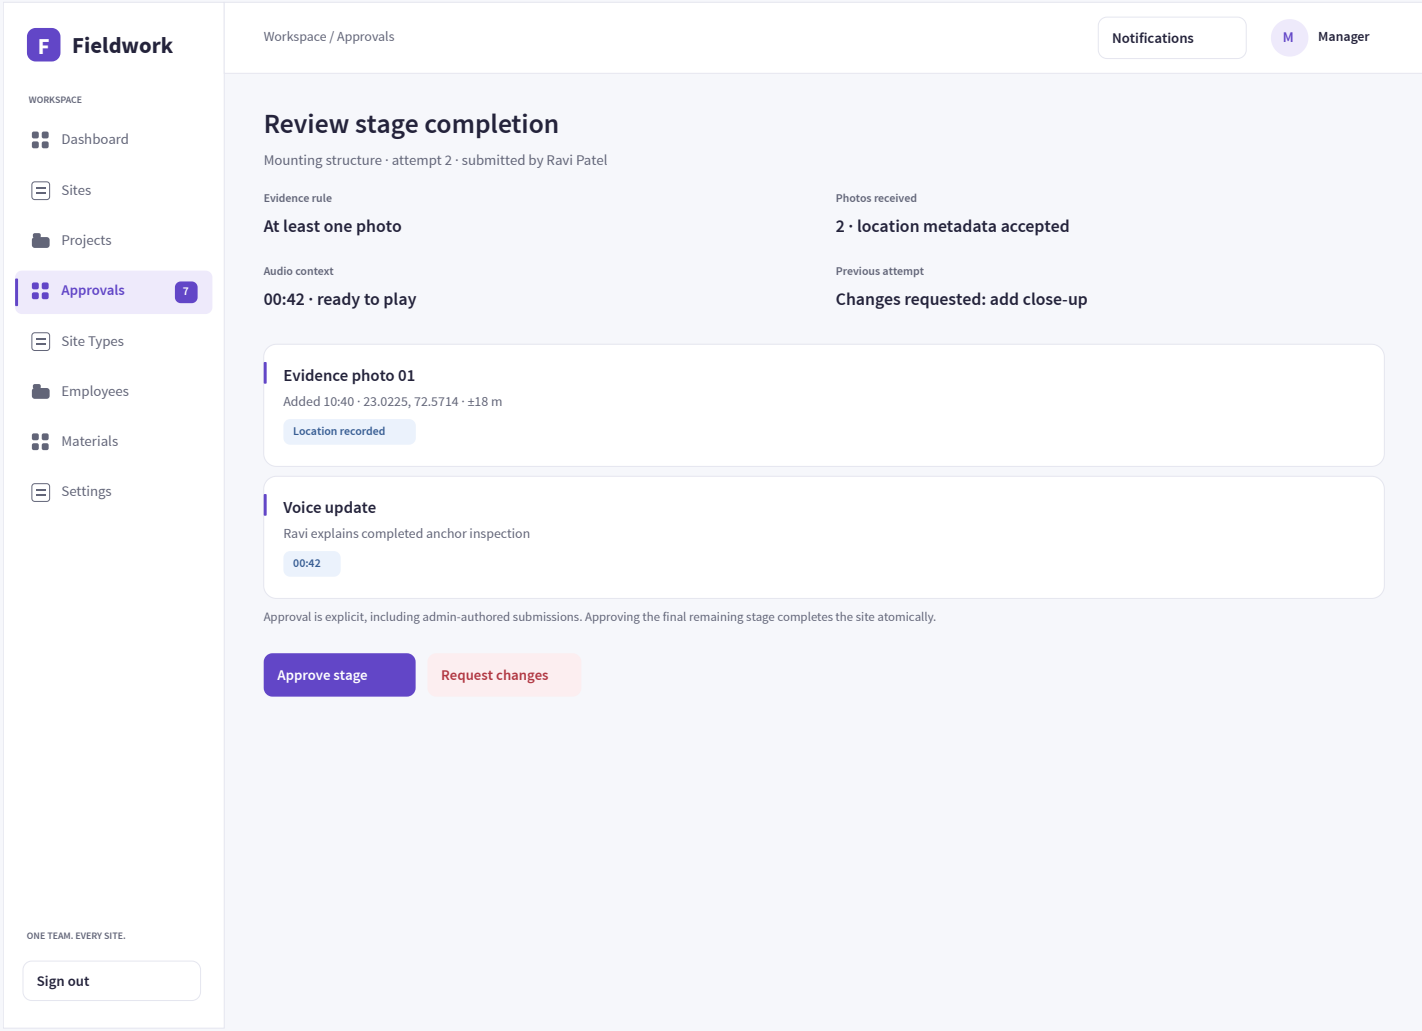

Request material sheet

06 / Completion stays explicit

Employee requests approval; admin reviews evidence and decides

FIELDWORK / CLIENT REVIEW

07 / Ready for review

Editable Penpot + browser walkthrough + complete screen PDF

152 screen and state designs.
9 user journeys. 27 acceptance mappings.

Mobile walkthrough

Open the browser gallery, select Employee, then Suryoday solar. Try Start, the three site tabs, and Add update.

Manager walkthrough

Review dashboard, site register, Stages & evidence, approvals, employees and inventory.

Design checks

22 automated contracts, rendered text checks on all screens, browser click paths, and real native Penpot import.

This package reviews design behavior. Live GPS, audio recording, server approvals, inventory transactions and durable offline sync require application implementation and device/integration testing.
